## Proposition 113

The (square) on a rational (straight-line), applied to an apotome, produces as breadth a binomial whose terms are commensurable with the terms of the apotome, and in the same ratio. Moreover, the created binomial has the same order as the apotome.

Let  $A$  be a rational (straight-line), and  $BD$  an apotome. And let the (rectangle contained) by  $BD$  and  $KH$  be equal to the (square) on  $A$ , such that the square on the rational (straight-line)  $A$ , applied to the apotome  $BD$ , produces  $KH$  as breadth. I say that  $KH$  is a binomial whose terms are commensurable with the terms of  $BD$ , and in the same ratio, and, moreover, that  $KH$  has the same order as  $BD$ .

For let  $DC$  be an attachment to  $BD$ . Thus,  $BC$  and  $CD$  are rational (straight-lines which are) commensurable in square only [Prop. 10.73]. And let the (rectangle contained) by  $BC$  and  $G$  also be equal to the (square) on  $A$ . And the (square) on  $A$  (is) rational. The (rectangle contained) by  $BC$  and  $G$  (is) thus also rational. And it has been applied to the rational (straight-line)  $BC$ . Thus,  $G$  is rational, and commensurable in length with  $BC$  [Prop. 10.20]. Therefore, since the (rectangle contained) by  $BC$  and  $G$  is equal to the (rectangle contained) by  $BD$  and  $KH$ , thus, proportionally, as  $CB$  is

to  $BD$ , so  $KH$  (is) to  $G$  [Prop. 6.16]. And  $BC$  (is) greater than  $BD$ . Thus,  $KH$  (is) also greater than  $G$  [Prop. 5.16, 5.14]. Let  $KE$  be made equal to  $G$ .  $KE$  is thus commensurable in length with  $BC$ . And since as  $CB$  is to  $BD$ , so  $HK$  (is) to  $KE$ , thus, via conversion, as  $BC$  (is) to  $CD$ , so  $KH$  (is) to  $HE$  [Prop. 5.19 corr.]. Let it have been contrived that as  $KH$  (is) to  $HE$ , so  $HF$  (is) to  $FE$ . And thus the remainder  $KF$  is to  $FH$ , as  $KH$  (is) to  $HE$ —that is to say, [as]  $BC$  (is) to  $CD$  [Prop. 5.19]. And  $BC$  and  $CD$  [are] commensurable in square only.  $KF$  and  $FH$  are thus also commensurable in square only [Prop. 10.11]. And since as  $KH$  is to  $HE$ , (so)  $KF$  (is) to  $FH$ , but as  $KH$  (is) to  $HE$ , (so)  $HF$  (is) to  $FE$ , thus, also as  $KF$  (is) to  $FH$ , (so)  $HF$  (is) to  $FE$  [Prop. 5.11]. And hence as the first (is) to the third, so the (square) on the first (is) to the (square) on the second [Def. 5.9]. And thus as  $KF$  (is) to  $FE$ , so the (square) on  $KF$  (is) to the (square) on  $FH$ . And the (square) on  $KF$  is commensurable with the (square) on  $FH$ . For  $KF$  and  $FH$  are commensurable in square. Thus,  $KF$  is also commensurable in length with  $FE$  [Prop. 10.11]. Hence,  $KF$  [is] also commensurable in length with  $KE$  [Prop. 10.15]. And  $KE$  is rational, and commensurable in length with  $BC$ . Thus,  $KF$  (is) also rational, and commensurable in length with  $BC$  [Prop. 10.12]. And since as  $BC$  is to  $CD$ , (so)  $KF$  (is) to  $FH$ , alternately, as  $BC$  (is) to  $KF$ , so  $DC$  (is) to  $FH$  [Prop. 5.16]. And  $BC$  (is) commensurable (in length) with  $KF$ . Thus,  $FH$  (is) And  $BC$  and  $CD$  are rational (straight-lines which are) commensurable in square only.  $KF$  and  $FH$  are thus

also rational (straight-lines which are) commensurable in square only [Def. 10.3, Prop. 10.13]. Thus,  $KH$  is a binomial [Prop. 10.36].

Therefore, if the square on  $BC$  is greater than (the square on)  $CD$  by the (square) on (some straight-line) commensurable (in length) with  $(BC)$ , then the square on  $KF$  will also be greater than (the square on)  $FH$  by the (square) on (some straight-line) commensurable (in length) with  $(KF)$  [Prop. 10.14]. And if  $BC$  is commensurable in length with a (previously) laid down rational (straight-line), (so) also (is)  $KF$  [Prop. 10.12]. And if  $CD$  is commensurable in length with a (previously) laid down rational (straight-line), (so) also (is)  $FH$  [Prop. 10.12]. And if neither of  $BC$  or  $CD$  (are commensurable), neither also (are) either of  $KF$  or  $FH$  [Prop. 10.13].

And if the square on  $BC$  is greater than (the square on)  $CD$  by the (square) on (some straight-line) incommensurable (in length) with  $(BC)$  then the square on  $KF$  will also be greater than (the square on)  $FH$  by the (square) on (some straight-line) incommensurable (in length) with  $(KF)$  [Prop. 10.14]. And if  $BC$  is commensurable in length with a (previously) laid down rational (straight-line), (so) also (is)  $KF$  [Prop. 10.12]. And if  $CD$  is commensurable, (so) also (is)  $FH$  [Prop. 10.12]. And if neither of  $BC$  or  $CD$  (are commensurable), neither also (are) either of  $KF$  or  $FH$  [Prop. 10.13].

$KH$  is thus a binomial whose terms,  $KF$  and  $FH$ , [are] commensurable (in length) with the terms,  $BC$  and  $CD$ , of the apotome, and in the same ratio. Moreover,  $KH$  will have the same order as  $BC$  [Defs. 10.5—10.10].

(Which is) the very thing it was required to show.
