### Proposition 3

To find the greatest common measure of three given numbers (which are) not prime to one another.

Let  $A$ ,  $B$ , and  $C$  be the three given numbers (which are) not prime to one another. So it is required to find the greatest common measure of  $A$ ,  $B$ , and  $C$ .

For let the greatest common measure,  $D$ , of the two (numbers)  $A$  and  $B$  have been taken [Prop. 7.2]. So  $D$  either measures, or does not measure,  $C$ . First of all, let it measure ( $C$ ). And it also measures  $A$  and  $B$ . Thus,  $D$  measures  $A$ ,  $B$ , and  $C$ . Thus,  $D$  is a common measure of  $A$ ,  $B$ , and  $C$ . So I say that (it is) also the greatest (common measure). For if  $D$  is not the greatest common measure of  $A$ ,  $B$ , and  $C$  then some number greater than  $D$  will measure the numbers  $A$ ,  $B$ , and  $C$ . Let it (so) measure ( $A$ ,  $B$ , and  $C$ ), and let it be  $E$ . Therefore, since  $E$  measures  $A$ ,  $B$ , and  $C$ , it will thus also measure  $A$  and  $B$ . Thus, it will also measure the greatest common measure of  $A$  and  $B$  [Prop. 7.2 corr.]. And  $D$  is the greatest common measure of  $A$  and  $B$ . Thus,  $E$  measures

$D$ , the greater (measuring) the lesser. The very thing is impossible. Thus, some number which is greater than  $D$  cannot measure the numbers  $A$ ,  $B$ , and  $C$ . Thus,  $D$  is the greatest common measure of  $A$ ,  $B$ , and  $C$ .

So let  $D$  not measure  $C$ . I say, first of all, that  $C$  and  $D$  are not prime to one another. For since  $A$ ,  $B$ ,  $C$  are not prime to one another, some number will measure them. So the (number) measuring  $A$ ,  $B$ , and  $C$  will also measure  $A$  and  $B$ , and it will also measure the greatest common measure,  $D$ , of  $A$  and  $B$  [Prop. 7.2 corr.]. And it also measures  $C$ . Thus, some number will measure the numbers  $D$  and  $C$ . Thus,  $D$  and  $C$  are not prime to one another. Therefore, let their greatest common measure,  $E$ , have been taken [Prop. 7.2]. And since  $E$  measures  $D$ , and  $D$  measures  $A$  and  $B$ ,  $E$  thus also measures  $A$  and  $B$ . And it also measures  $C$ . Thus,  $E$  measures  $A$ ,  $B$ , and  $C$ . Thus,  $E$  is a common measure of  $A$ ,  $B$ , and  $C$ . So I say that (it is) also the greatest (common measure). For if  $E$  is not the greatest common measure of  $A$ ,  $B$ , and  $C$  then some number greater than  $E$  will measure the numbers  $A$ ,  $B$ , and  $C$ . Let it (so) measure ( $A$ ,  $B$ , and  $C$ ), and let it be  $F$ . And since  $F$  measures  $A$ ,  $B$ , and  $C$ , it also measures  $A$  and  $B$ . Thus, it will also measure the greatest common measure of  $A$  and  $B$  [Prop. 7.2 corr.]. And  $D$  is the greatest common measure of  $A$  and  $B$ . Thus,  $F$  measures  $D$ . And it also measures  $C$ . Thus,  $F$  measures  $D$  and  $C$ . Thus, it will also measure the greatest common measure of  $D$  and  $C$  [Prop. 7.2 corr.]. And  $E$  is the greatest common measure of  $D$  and  $C$ . Thus,  $F$  measures  $E$ , the greater (measuring) the lesser. The very thing is impossible. Thus, some number which is greater than  $E$  does not measure the numbers  $A$ ,  $B$ , and  $C$ . Thus,  $E$  is the greatest common measure of  $A$ ,  $B$ , and  $C$ . (Which is) the very thing it was required to show.
